

Q: What happened during incident INC-2026-0814?

A: PaymentService pods repeatedly restarted after a deployment. Only one of three pods remained healthy, while the other pods repeatedly restarted.

Q: What was the primary symptom?

A: The primary symptom was repeated PaymentService pod restarts and liveness probe failures.

Q: What caused the PaymentService pods to restart?

A: The incident was caused by PostgreSQL transaction timeouts. The application became unhealthy when database transactions exceeded the expected timeout.

Q: Which service was affected by the incident?

A: PaymentService was directly affected.

Q: Which database was related to the incident?

A: Payment PostgreSQL was related to the incident.

Q: What should be investigated after this incident?

A: Investigate PostgreSQL transaction duration, long-running transactions, database resource utilization, application database timeouts, and Kubernetes liveness probe behavior.
