

Q: What happened during incident INC-2026-0821?

A: Payment transactions experienced timeouts because PaymentService could not obtain database connections within the expected time.

Q: What was the root cause?

A: The root cause was PostgreSQL connection pool exhaustion.

Q: Which service was affected?

A: PaymentService was affected.

Q: Which database was involved?

A: Payment PostgreSQL was involved.

Q: What happens when the database connection pool is exhausted?

A: New requests cannot obtain database connections and may wait until a timeout occurs. This can cause payment requests to fail or become slow.

Q: What should be checked when connection pool exhaustion occurs?

A: Check the configured pool size, active database connections, connection acquisition time, long-running transactions, application concurrency, and PostgreSQL connection limits.
