

Q: What should I check when PaymentService cannot access Redis?

A: Check Redis availability, network connectivity, authentication configuration, connection limits, and application Redis client errors.

Q: What symptoms can occur when Redis is unavailable?

A: Applications may experience increased latency, cache misses, connection errors, or failures in functionality that depends on Redis.

Q: Does Redis replace the Payment PostgreSQL database?

A: No. Redis is used as a supporting data store or cache, while Payment PostgreSQL is the primary relational database for PaymentService.

Q: What should I check if Redis latency increases?

A: Check Redis CPU and memory utilization, command latency, network latency, client connection counts, and slow commands.
